I now run South on a blank line from the corner to secs. 1, 6, 7 & 12 and find the east boundary correct as to alignment but that the SE corner of the township is 5 miles 13 chs South of my starting corner.

This corresponds with my chaining on the West boundary and shows the old work to be measured too long.

October 18th 1894

From the S. E corner of the township I run W. on or a blank line and again find the alignment to be correct, but the length of the South boundary to be 6 miles & 18 chs.

As (allowing for convergency of meridians) this verifys my work on the north boundary and as no subdivision lines have been closed on the south or east boundaries I now proceed to resurvey the same as follows.
