General Description

The land within that portion of T. 33 S., R. 66 E., resurveyed is located along the Colorado River, about 7 miles southwest of Davis Dam. Most of the land consists of the old flood plain of the river ascending into the rolling desert on the west side. The northwest part of sec. 5 lies in the rugged foothills of the Newberry Mountains.

The soil varies from sandy loam and silt in the bottom land to sandy gravel and exposed granite formation in the mountains.

There is a dense undergrowth of arrowweed, willow and mesquite in the bottom land and scattered creosote (greasewood) brush and cacti on the desert area.

There is one old Indian settler in sec. 9, near the ¼ sec. cor. of secs. 8 and 9.

The graveled road from Needles to Davis Dam runs through the area, in part along the restricting levee in the rechannelization of the river and in part through the bottom land. A road leading to the quarry pit from which rock was extracted for revetment and jetty purposes, runs along the line bet. secs. 8 and 9 and part of the line bet. secs. 16 and 17, thence southwesterly to the quarry.

There is no evidence of present or past mining activity or minerals present.
