

62

GENERAL DESCRIPTION.

The land in this township is principally mountainous, the soil, nearly all sandy and rocky, of 3rd. and 4th. rate and chiefly valuable for grazing purposes, as there is a heavy growth of bunch grass, even on the very rocky soil.

Mr. John Hardman, has irrigated about eighty acres of sage brush land in sections 17 and 18, during the past eight years and now has a meadow, producing a good quantity of excellent hay.

Along several of the small streams, there is a dense growth of small aspen trees, some as large as eight inches in diameter.

Gold has been found in sections 6 and 7, but there is no evidence of other minerals in any portion of the township.

The land is fairly well watered by small creeks and springs, kept up by the heavy snow fall in this portion of the state.

Nearly all of the township is used as summer range by the cattle and sheep men, because of the heavy growth of bunch grass.

There is one settler in each of sections, 9, 17, 18 and 29.

Geo. S. Nickerson,

U. S. Deputy Surveyor.
