GENERAL DESCRIPTION.

The surface of the ground embraced within the survey as shown by the foregoing field notes, consists generally of heavily rolling land, except the north half of the west boundary, which is rough mountainous land.

The soil may be classed as 3rd. rate, consisting of little or no loam, with sand and gravel as the principal constituents.

There is no timber in the township.

The usual sage and other desert brush are abundant.

There is no available water closer than the Humboldt River some 9 miles to the east; and this is hardly fit for drinking purposes.

Along the north half of the west boundary, distinct mineral indications are disclosed, the formation being mainly volcanic. In section 19 there has been considerable mining development done on ledges that appear to carry silver and lead values. Apparently there has been no active work done here for several years.

There are no settlers in the township.
