## General Description.

The surface of this township is nearly all flat or gently rolling. The Antelope range of mountains extend into this township in the E. range of secs. Although high rugged mountains to the N., in this township, they are merely high hills. The extreme S. W. portion of the township is rough and mountainous. The west part of the township is a gradual E. slope, the land gradually ascending to the foot of high rugged mountains to the W. The soil is generally sandy and gravelly clay, containing little or no loam except near the springs and along the streams. In places, the soil is alkaline. The springs shown are small and do not flow enough water for any extensive irrigation. Since
