General Description.

The land in this tp can be divided into three general classes. That lying south of a line running roughly, from the cor. of secs. 4, 5, 32 and 33 on the S. bdy. to the cor. of secs. 26, 27, 34 and 35; thence to the cor. of secs. 25, 26, 35 and 36; and thence to the 1/2 cor. E. of sec. 25, on the E. bdy. of the tp.; is level land in the Humboldt river bottom. This land is an adobe loam soil, probably eight or ten feet in depth, and has been derived in most part from the disintegration of the surrounding volcanic mountains. It is good, fertile soil; with a gentle S.W. slope, if irrigated it would produce excellent crops of those things suited to the climate. It is very doubtful if it would produce crops without irrigation.
