

## Resurvey of the East Boundary of T. 30 N., R. 40 E.

Chains

with a tack driven in the hub already set 5-chs. N. of my station and on which the meridian falls 0.5 ins. east of the point determined with the solar.

At 8h. 00m., a.m., l.m.t., I set off  $40^{\circ} 28'$  N. on the Lat. arc;  $8^{\circ} 6'$  N. on the decl. arc; and mark a point in the meridian determined with the solar, on the hub already set 5-chs. N. of my station; at this point is 0.2 ins. east of the meridian established by Polaris observation.

The solar apparatus, by p.m. and a.m. observations, defines positions for meridians, respectively about  $0' 26''$  west and  $0' 10''$  east of the meridian established by the Polaris observations; therefore, I conclude that the adjustments of the instrument are satisfactory.

The magnetic bearing of the true meridian, at 9h. 00' a.m., is N.  $18^{\circ} 15'$  W., the angle thus determined gives the magnetic decl.  $18^{\circ} 15'$  E.

Similar tests were made on Transit No. 8572 with Smith Solar attachment, and the instrument was found to vary at less than  $1'$  of arc from the meridian established by observation on Polaris.

Sept. 2. 1914.

## Resurvey of the East Boundary by H.W. Reppert.

Aug. 15, 1914: I begin at the cor. of Tps. 29 and 30 N., Rs. 40 and 41 E., Latitude  $40^{\circ} 25'$  N., Longitude  $117^{\circ} 24'$  W., which is an iron post, heretofore described in the field notes of T. 29 N., R. 40 E. At this cor. I make a direct observation on the sun for latitude as follows:

Time of observation 10h. 04m. 29s., p.m., l.m.t.

Observed altitude of the sun,

Reading direct (lower limb)  $63^{\circ} 42\frac{1}{2}'$

" reversed " "  $63^{\circ} 45\frac{1}{2}'$

Mean observed altitude  $63^{\circ} 44'$

From this data I calculate the latitude at this cor. to be  $40^{\circ} 25'$  N. which agrees with the calculated latitude.

At this cor. I set off  $40^{\circ} 25'$  N. on the lat. arc;  $14^{\circ}$
