GENERAL DESCRIPTION.

The portion of this township included in this survey is all mountainous, not exceptionally rough and rugged, but averaging very steep and high. The highest part is about a mile long and runs almost parallel to the line between sections 11 and 12 and about 10 chains West thereof. This is approximately 2000 ft. higher than the lowest part. The south end of this mountain is a part of the divide between Kings River and Cottonwood Creek.

This divide extends through the tract with a bearing almost exactly northeast and southwest.

The soil of the hill tops and sides averages quite rocky, but nearly all of it produces a good growth of bunchgrass. The valleys of the ravines and draws have a very fertile alluvial soil, producing a heavy growth of sagebrush. These valleys however are in nearly every case too narrow to be of any value whatever for agricultural purposes. Along nearly every stream of water there is a growth of small timber, consisting of aspen, alder and willow. There are also occasional thickets of aspen and patches of mountain laurel on the mountain sides.

While water is not abundant in the township, yet there is sufficient to make the tract almost ideal for grazing.

There are a number of deserted cabins, probably erected by prospectors, on the tract, but only one settler permanently resident. This is Guan Mentaberry, who has established a home in section 36.

Very respectfully,  
 Walter E. Hoffman  
 U.S. Surveyor.
