GENERAL DESCRIPTION.

This township consists of mountainous land in the S. E. portion, rolling in the central and N. E. portions, and level valley in the west portion. The mountains in the S. E. portion are rolling on the eastern slope and very rough broken and steep on the western slope. The formation here is mostly granite, limestone and gypsum.

The soil in the mountainous portion is generally a dark loose clay loam, gravelly and rocky, the draws and ravines with a deep rich dark loam which is fairly free from rock. a deep rich dark loam is found along the bottom land of Antelope Creek which flows through secs. 13, 14, 15 and 24. The soil of the valley land consists mostly of a loose light clay loam, gravelly in places and fairly free from rock, except along the base of the mountains where the soil is mostly an accumulative wash from the steep mountain slopes and mixed with limestone, granite and quartzite boulders.
 The west tier of secs. border along the east edge of a dry alkali lake, where the soil is a dark heavy clay,
