General Description

The fractional part of the township included in this survey lies on the northern end and slope of the Black Rock range of mountains, and consists of mountainous, rolling and bench land. The highest mountains are south of the north branch of Mahogany creek, north of which creek the mountains are more of a rolling nature, with gently rolling bench land predominating in the northern part of the township included in this survey. The soil in general is a heavy clay or adobe, mixed with rocks of volcanic formation, although some deep, rich alluvial loam, quite free from rock, is found along the creeks and ravines. As a general case, however, this land occupies very narrow and small segregated portions, owing to which fact, it is of little or no value for
