General Description, T. 10N., R. 52 E.

The land within the boundaries of this fractional township is generally hilly and broken mountainous in character. The main divide or ridge between the Hot Creeks Creek valley on the west and the Little Smoky valley on the east extends in a general northerly direction thru the central part of the township. From this ridge, low broken spurs extend in a general easterly direction for several miles before terminating at the west edge of the Little Smoky Valley while to the west of the main divide, high mountainous spurs project abruptly into the edge of the narrow valley in a general southwesterly direction.

The soil varies from a fine loose sand along the bottoms of the shallow draws to a heavy clay and rocky loam on the high rocky slopes. None of the soil appears to be very fertile. Grasses for grazing are found only on the higher slopes, on which are also found the heaviest stands of juniper and pinon pine timber. This timber is usually quite scrubby and of little or no commercial value other than for use as fuel or fence posts.

The extreme eastern part of the township is rolling in character. Sagebrush and buck brush grows very densely in this portion; the timber becomes more scattering.
