

GENERAL DESCRIPTION.

This township is rolling to rough mountainous land except for the northeastern portion, which lies on low rolling gravelly and sandy slopes extending in a general easterly direction.

A main spur or ridge of the Hot Creek mountains (or a spur ridge from the Pancake range as it is locally known) extends in a general northerly direction from section 34 on the south through the central part of the township and on out through section 2 on the N. boundary. This main ridge continues in a northerly direction for about one mile and then turns in a general north-west direction.

The slopes are rugged and rocky and are covered with a medium to heavy stand of juniper and pinon timber. On the lower slopes there is a fairly dense growth of sagebrush, buckbrush, deerbrush and yellow top. All slopes, except the high and rocky barren exposures afford good grazing during the early spring and summer months for both cattle and sheep. Sheep are extensively grazed in this area in the late fall or early winter months. The lack of water limits these lands as grazing areas except in the winter or early spring, when the snows furnish ample water for the stock.

There is but one spring in the township, located in the NW $\frac{1}{4}$, NW $\frac{1}{4}$ of section 20 and is on land occupied by the applicant for survey, Phillip Egoscue, who has erected a substantial three room stone house in the NE $\frac{1}{4}$ of section 19, built a reservoir in the NE $\frac{1}{4}$ of section 19, and also cultivates some 20 acres along the creek bottom. He has about 80 acres under fence.

No indications of minerals are noted.
