No auxiliary accessory.

From this corner, the reestablished cor. of Ts. 6 and 7 S., R. 61 E., which is monumented with an iron post, 2½ ins. diam., firmly set, mkd. and witnessed as described in the field notes of the dependent resurvey of the east boundary of T. 7 S., R. 61 E., executed concurrently under this same survey group, bears South, 2.87 chs. dist.

Land, east half, gently sloping desert valley; west half, mountainous.

Soil, east half, sandy clay loam; west half, mostly rocky.

Timber, scattered Joshua trees; undergrowth, sagebrush, rabbit brush, greasewood, and cacti.

General Description

The greater portion of this township is made up of very gently rolling desert valley which is cut by numerous dry washes, draining generally to the southwest. However, there is some rather rough mountainous land along the south boundary and again in the northwest corner of the township.

Elevations over the valley vary from about 4500 to 6000 feet above sea level. The lowest elevation being near the southwest corner and the highest being near the northwest corner of the township. About sixty per cent of the central part of the township lies below 5000 feet in elevation.

The soil over most of the township consists of a light colored sandy to rocky clay loam. The only timber found growing in the township consists of very scattered Joshua trees and a few yucca. Undergrowth consists mainly of scattered sagebrush, greasewood, and some rabbit brush, bunch grass, and cacti.

A bladed dirt road crosses the township in the northeast-southwest direction, from near the northeast to near the southwest township corners.

A single wire telephone line crosses the northwest portion of the township from the north boundary of section 3 to the west boundary of section 7.

The area is mainly valuable for winter stock grazing, this being the only season of the year when stock water is usually available.
