deposit broken glass around the iron post, 10 ins. below the surface of the ground.

From this corner, the 1/4 sec. cor. of sec. 31, T. 17 N., R. 60 E., heretobefore described, bears East, 2.96 chs. dist.

GENERAL DESCRIPTION

This township is situated 20 to 25 miles west - southwest of Ely, Nevada, in Jake's Valley which lies on the west side of the Egan Range, and is approximately 6,300 feet above sea level in the valley floor, and the land rises to approximately 6,600 feet above sea level along the east side of the township.

Drainage channels which flow into the township from the south and east, fan out and disappear before they reach a depression in the central and northern portion of the township.

The soil in the township is a light colored alkaline clay, and in general is a sandy and gravelly clay loam in character. There is no timber and the undergrowth consists mostly of white sage, but there is also some sagebrush, rabbit brush, black brush and some greasewood and shadscale.

There are no settlers living in the township. There is one stock water reservoir which has been developed; it is located along the south boundary of section 33 in the SE. portion, as the area is chiefly valuable for stock grazing.

There are several roads that traverse from the south to the north through the township, as well as criss-cross roads that lead to the stock water developments.
