1983

Deposit the decayed remains of the original wooden post and set a steel fence post, 5 ft. long, alongside the aluminum post.

From this corner, Cor. No. 2 of M.S. 4195, Nevhum lode, hereinbefore described bears S. $88^{\circ} 00'$ E., 3.058 chs. dist.

GENERAL DESCRIPTION

The area surveyed and resurveyed within Township 31 North, Range 33 East, varies from mountainous in the east portion to nearly level in the southwest central portion with the remaining portion being gently rolling. The elevation ranges from about 4,300 to 7,600 ft. above sea level. The soil varies from clay loam and rocky on the higher elevations to sandy clay loam on the more level portions. The vegetation consists of sagebrush, native grasses, rabbitbrush, Brigham tea and shadscale. There are pinon pine and juniper located in the mountainous portions with willows and cottonwood in the canyon bottoms. There are many canyons in the mountainous east portion with the biggest ones being Eldorado, Antelope, Black, Johnson, Florida and Humboldt. The major drainages are all in a westerly direction into the Humboldt River. Access is by rough trail roads into mining activity in the mountains. Interstate Highway No. 80 enters the township in section 33, proceeds in a northerly direction changing to northeasterly and leaves in section 3.

There are many tunnels and prospects located in the mountains indicating much mining activity in the past although there are no active operations presently. Patented mineral surveys are located in sections 1, 2, 12 and 13.
