GENERAL DESCRIPTION	
The portion of Township 41 North, Range 62 East, that was resurveyed varies in elevation from about 6,200 to 6,600 ft. above sea level. The land is rolling with the soil consisting mostly of clay and some sandy loam near the several creeks. All drainages are in an easterly or northeasterly direction into Thousand Springs Creek. Access is provided by trail roads that join into an improved gravel road for barite hauling trucks that runs in a generally N. and S. direction after entering the township in section 1. There is a spring located in sec. 36. The principal users of the area are hunters, ranchers and miners. Vegetation consists of sagebrush, bleeding heart, cacti, willows, buckbrush and native grass. No mineral formations of consequence were noted during the survey.
