25.10	Trail road, bears irregularly N. and S.
41.534	The C-S $\frac{1}{16}$ sec. cor. of sec. 30.
GENERAL DESCRIPTION	
<p>The portion of the township that was resurveyed or subdivided is located at the end of the Leonard Creek improved gravel road on the east side of the Black Rock Range. The elevation varies from 4100 to 5200 feet above sea level. The terrain is nearly flat with pastures and native hay meadows to mountainous. There are several sources of water coming out of canyons located westerly of the resurveyed area. The principal water source is Paiute Creek (formerly spelled "Pahute") which enters the township in section 6, flows in a southeasterly direction and exits the township in the area of the center <math>\frac{1}{4}</math> of section 16. The soil is predominately sandy loam in the bottom areas to rocky in the mountainous part. Vegetation for the most part consists of sagebrush, native hay meadows and pastures near Paiute Creek, scattered shadscale, rabbitbrush, Brigham tea, cacti and native grass. Willows are found along the water courses.</p> <p>Access is provided by numerous trail roads taking off from Leonard Creek improved gravel road. Paiute Creek ranch with many structures is located in the northeast quarter of section 7. The south end of a small reservoir straddles the section line between sections 7 and 18. Cane Spring and a stone walled corral is located in the northeast quarter of section 30. There are some seep springs scattered in section 31. The principal users of the area are hunters and ranchers. No mineral formations of any consequence were noted during the course of the resurvey.</p>
